## DTIC QUALITY INSPECTED

### **EXECUTIVE SUMMARY**

This document presents the procedures used for Design Qualification Test and Evaluation (DQT&E) testing of the General National Airspace System (GNAS) Maintenance Control Center (GMCC). As Test Director, ACN-250 conducted DQT&E testing at the Federal Aviation Administration (FAA) Technical Center, Atlantic City International Airport, NJ.

The purpose of DQT&E testing is to verify that the phase I and phase II GMCC design requirements are met. The phase I configuration consists of Commercial-Off-The-Shelf (COTS) hardware and software procured from the Office Automation Technology and Services (OATS) contract. The phase II configuration included a Local Area Network (LAN) interfaced to the Maintenance Processor Subsystem (MPS), status board monitor, and weather display.

Successful completion of DQT&E establishes the GMCC design baseline configuration. Any hardware changes to the configuration will require repeating DQT&E testing. Software changes may require retesting, depending on the extent or nature of the changes.

A DQT&E Test Report will be prepared upon completion of testing.

### PURPOSE.

The General National Airspace System (GNAS) Maintenance Control Center (GMCC) provides continuous real-time automation support to Federal Aviation Administration (FAA) maintenance personnel for the monitoring, control, and maintenance of FAA facilities, systems, and equipment. The GMCC will centralize the management and control of maintenance operations for all National Airspace System (NAS) facilities under GMCC jurisdiction. In addition, the GMCC will automate maintenance operations, including remote monitoring of facilities and equipment, alarm processing, restoration, certification, and preventive maintenance (PM).

The Design Qualification Test and Evaluation (DQT&E) will be performed in three phases. Each phase is described below:

- a. Phase I: Since the phase I GMCC was previously tested during the Maintenance Data Terminal (MDT) evaluation, DQT&E testing will only consist of the standard Office Automation and Technology Services (OATS) contractual demonstration.
- b. Phase II: All phase II interfaces and functions will be tested, including the network to the Maintenance Processor Subsystem (MPS), MPS functions, the Local Area Network (LAN), workstation software, and external services.
  - c. Phase III: Testing will include all GMCC graphics and enhancements.

This document describes step-by-step procedures of phase I and phase II testing, for the purpose of verifying that the functionality of the GMCC system is satisfied by the software and hardware elements procured under the FAA's Office of OATS' contract and that these elements meet the design requirements as previously established during the prototype development and design selection efforts. It provides the test location, test schedules, test assumptions, and test operation instructions.

### 2. LOCATION AND SCHEDULE.

### 2.1 TEST LOCATION.

The DQT&E testing will take place at the FAA Technical Center site.

### 2.2 TEST SCHEDULE.

Ten working days have been allocated for DQT&E testing. Test results will be documented in a Letter of Findings and a Test Report. The Letter of Findings will be delivered 10 working days after completion of the testing. The draft GMCC DQT&E Test Report will be delivered 45 working days after completion of the testing. This Test Report will include a matrix listing the functions tested and will identify a pass/fail result for each function. It will also identify whether the system as a whole passes or fails.

### 3. REFERENCE DOCUMENTS.

### 3.1 GMCC PROGRAM DOCUMENTATION.

- a. GMCC Type A System Specification, FAA-E-2875, December 5, 1990, DOT/FAA.
- b. GMCC Type B1 Prime Item Specification, FAA-EE-005D, June 22, 1990, DOT/FAA.

### 3.2 RMMS PROGRAM DOCUMENTATION.

- a. NAS System Specification, Functional and Performance Requirements for the National Airspace System General, NAS-SS-1000, Volume I, December 1986, DOT/FAA.
- b. NAS System Specification, Functional and Performance Requirements for the National Airspace System Maintenance and Operations Support Element, NAS-SS-1000, Volume V, December 1986, DOT/FAA.
- c. Remote Maintenance Monitoring System Interface Control Document MPS to RMS and RMSC, NAS-MD-790, June 10, 1986, DOT/FAA.
- d. Functions and Operational Requirements of the NAS Maintenance Control Center, NAS-MD-794, March 15, 1986, DOT/FAA.

### 3.3 OTHER DOCUMENTATION.

- a. Draft Design Qualification Test Plan for the GNAS MCC, June 18, 1990.
- b. NAS Operational Test and Evaluation (OT&E)/Integration of the Interim Monitor and Control Software (IMCS) Test Procedures, DOT/FAA/CT-TN90/43, June 1991.

### 4. GMCC DOT&E PROCEDURES.

The GMCC DQT&E test approach is based on the requirements defined in the GMCC Type A System Specification, FAA-E-2875, and GMCC Type Bl Prime Item Specification, FAA-EE-005D (reference documents 3.1.a and 3.1.b). Each requirement or specification will be verified through implementation of one or more test sequences. Each test sequence may verify more than one requirement or specification. In order to provide traceability between the Test Procedures and the FAA-E-2875 requirements, a Test Verification Requirements Traceability Matrix (TVRTM) is provided in appendix A. Tests have been defined to address each grouping of requirements.

Appendix B contains the TVRTM which specifies NAS requirements to be verified during this phase of testing. Because phase I was previously tested via the MDT/OATS evaluation, and phase III is not available, DQT&E focuses on phase II requirements.

### 4.1 DOT1 - COMPONENT INSPECTION, INITIALIZATION, INTEGRATION, AND CHECKOUT TEST.

### 4.1.1 Test Objectives/Expectations.

The objective of this test is to verify that each GMCC component is undamaged and operational. Each component will be examined for outward physical damage prior to power up or connection to any other component. This test will be performed by American Telephone and Telegraph Company (AT&T) as part of phase I testing.

### 4.1.2 Test Assumptions and Interdependencies.

For DQT1, it is assumed that the GMCC workstation and accompanying documentation is available at the test site. Component failure will not prevent advancing to the next test series unless it is a critical component for the following test sequences.

### 4.1.3 Manning and Responsibilities.

The DQT1 has the following personnel requirements:

- a. Test Manager Responsible for briefing the test team, defining the necessary test team assignments, coordinating the test resources, assuring proper recording of the test results, red-lining test procedures to reflect as-tested activities, the coordination of Trouble Reports, and debriefing the test team.
- b. Test Engineers Responsible for inspecting the components, recording the condition of the components (i.e., noting any damaged components) during the AT&T unpacking, setup, integration, and initialization.
- c. AT&T Responsible for unpacking, setting up and initializing GMCC workstations, LAN, and other components.

### 4.1.4 Test Support Hardware and Software.

The following items will be required to support DQT1:

- a. GMCC equipment
- b. Printers as required at the GMCC workstation and MPS.
- c. Appropriate software Microgate 6530 Emulation Software to provide GMCC access to Maintenance Management System (MMS)/Interim Monitor and Control Software (IMCS), and the following GMCC/OATS software: MS-DOS 3.3, Unix System V Operating System (OS), Microsoft Excel for Windows, Microsoft Word for Windows, StarLAN Software, Superbase 4, PackRat, Back-It and Status Board. Service A and B interfaces were not available.

### 4.1.5 Test Operation Instructions.

The information required to perform DQT1 is provided in this section.

### 4.1.5.1 Test Setup.

The test setup for DQT1 assumes that the StarLAN network is fully operational and all required hardware and software is available for network functionality.

### 4.1.5.2 Test Conduct.

The DQT1 consists of one test sequence which is provided in appendix C. As installation of each component is performed, power will be applied and pass/fail determination will be made as to whether or not proper operation has been achieved based upon manufacturer's accompanying documentation. Components that use central or intelligent processors will be initialized with accompanying software as applicable. Pass/fail determination will be made as to whether or not proper operation has been achieved based upon manufacturer's accompanying documentation.

After all components are powered on and initialized, they will be integrated into a system configuration and observed to determine if physical connection of one device to another causes any adverse operational effects.

### 4,1.5.3 Termination and Restart of Test.

Not applicable.

### 4.1.5.4 Safety Considerations.

The DQT1 does not require any special safety considerations.

### 4.1.6 Test Data Reduction and Analysis.

Pass/fail determinations for DQT1 will be made by inspection. Data analysis for this test is not applicable. Successful completion will be indicated by a pass/fail method. Should a component fail as a result of the conduction of DQT1, the component will be retested if deemed appropriate by the test manager. Component failure will not preclude advancing to the next test sequence unless it is a critical component for the following test sequences.

### 4.2 DOT2 - LOCAL AREA NETWORK/SOFTWARE CHECKOUT TEST.

### 4.2.1 Test Objectives/Expectations.

The objective of this test is to verify that all communications connections/interfaces are operational and commercial-off-the-shelf (COTS) software installed on the Local Area Network (LAN) is accessible and operates in a manner prescribed by manufacturer's documentation. This test will be performed by ACN-250 as part of phase II testing.

### 4.2.2 Test Assumptions and Interdependencies.

For DQT2, it is assumed that the GMCC workstation and accompanying documentation is available at the test site. Failure of the LAN to operate in the prescribed manner will preclude advancing to the next test series.

### 4.2.3 Manning and Responsibilities.

The DQT2 has the following personnel requirements:

a. Test Manager - Responsible for briefing the test team, defining the necessary test team assignments, coordinating the test resources, assuring proper recording of the test results, red-lining test procedures to reflect as-tested activities, the coordination of Trouble Reports, and debriefing the test team.

- b. Test Engineers Responsible for execution of test activities including operation of the equipment, recording of test data, and analysis of test data to determine results.
- c. GMCC Technician Responsible for maintaining MPS configuration, assisting in MMS/IMCS startup, and assisting in backing up test data. The MPS operator must be on call to maintain MPS operation and support testing if necessary.

### 4.2.4 Test Support Hardware and Software.

The following items will be required to support DQT2:

- a. GMCC equipment (four GMCCs connected to one MPS via BROUTERS and modems).
- b. MPS RMMS interface to the GMCC. The IMCS software running on the MPS will be used to monitor the Remote Monitoring Subsystem (RMS) operations and provide remote control of RMS subsystems for maintenance functions. The MMS software running concurrent with IMCS software will be used to perform administrative type functions.
  - c. Printers as required at the GMCC workstation and the MPS.
- d. Appropriate software Microgate 6530 Emulation Software to provide GMCC access to MMS/IMCS, and the following GMCC/OATS software: MS-DOS 3.3, Unix System V Operating System (OS), Microsoft Excel for Windows, Microsoft Word for Windows, StarLAN Software, Superbase 4, PackRat, Back-It and Status Board. Service A and B interfaces were not available.

### 4.2.5 Test Operation Instructions.

The information required to perform DQT2 is provided in this section.

### 4.2.5.1 Test Setup.

The LAN will be set up as specified in the manufacturer's documentation. An interface to the Tandem will be provided to access MMS/IMCS functions.

### 4.2.5.2 Test Conduct.

The DQT2 consists of 11 test sequences provided in appendix C.

General StarLAN network commands will be performed and the results of the commands will be observed in test sequence DQT2.1 and DQT2.2. The StarLAN network will be used to access GMCC/OATS software located on the primary server. All COTS software packages will be accessed simultaneously from each General Purpose Workstations (GPWS). These test sequences are numbered DQT2.3 through DQT2.11 and are described below:

- a. DQT2.1 Network Administration Test This test will verify that system administration functions can be performed from the network server.
- b. DQT2.2 LAN Checkout Test This test will verify that general StarLAN network commands can be performed at each GMCC workstation using the StarLAN network software. Links to the server will be established and verified. A server administration test will also be performed.

- c. DQT2.3 MS-DOS Software Checkout Test This test will verify that the Disk Operating System (DOS) is resident and functional on each GMCC workstation. Basic DOS commands will be issued and the results recorded.
- d. DQT2.4 Unix V OS Software Checkout Test This test will verify that the Unix V OS is resident and functional on the GMCC server. Basic Unix V OS commands will be issued and the results recorded.
- e. DQT2.5 Microsoft Excel Software Checkout Test This test will verify that access to the Microsoft Excel software is resident and functional on each GMCC workstation.
- f. DQT2.6 MicroGate 6530 Software Checkout Test This test will verify that access to the MicroGate 6530 software is resident and functional on each GMCC workstation.
- g. DQT2.7 Superbase 4 Software Checkout Test This test will verify that access to the Superbase 4 software is resident and functional on each GMCC workstation.
- h. DQT2.8 PackRat Software Checkout Test This test will verify that access to the PackRat software is resident and functional on each GMCC workstation.
- i. DQT2.9 Back-It Software Checkout Test This test will verify that access to the Back-It software is resident and functional on each GMCC workstation.
- j. DQT2.10 Word for Windows Software Checkout Test This test will verify that access to the Word for Windows software is resident and functional on each GMCC workstation.
- k. DQT2.11 Microsoft Windows Software Checkout Test This test will verify that access to the MS-Windows software is resident and functional on each GMCC workstation. It will also verify that simultaneous operations can be performed using MS-Windows from one GMCC workstation.

### 4.2.5.3 Termination and Restart of Test.

The DQT2 may be terminated and then restarted at the last completed test step.

### 4.2.5.4 Safety Considerations.

The DQT2 does not require any special safety considerations.

### 4.2.6 Test Data Reduction and Analysis.

The success of the test will be determined by the system's ability to meet the requirements and give the predicted responses to the step-by-step procedures presented in the Test Conduct Forms for DQT2 in appendix C.

### 4.3 DOT3 - FULL SERVICE SYSTEM STATE VERIFICATION.

### 4.3.1 Test Objectives/Expectations.

The objective of this test is to verify Full Service System State requirements. The GMCC full service system state is defined as all workstations, processors, and communications lines being fully operational. A series of tests and demonstrations will be performed to verify Full Service System State requirements as stated in the following paragraphs.

### 4.3.2 Test Assumptions and Interdependencies.

For DQT3, it is assumed that the GMCC workstation and accompanying documentation is available at the test site. Failure of the LAN to operate in the prescribed manner will preclude advancing to the next test series.

### 4.3.3 Manning and Responsibilities.

The DQT3 has the following personnel requirements:

- a. Test Manager Responsible for briefing the test team, defining the necessary test team assignments, coordinating the test resources, assuring proper recording of the test results, red-lining test procedures to reflect as-tested activities, the coordination of Trouble Reports, and debriefing the test team.
- b. Test Engineers Responsible for execution of test activities including operation of the equipment, recording of test data, and analysis of test data to determine results.
- c. GMCC Technician Responsible for maintaining MPS configuration, assisting in MMS/IMCS startup, and assisting in backing up test data. The MPS operator must be on call to maintain MPS operation and support testing if necessary.

### 4.3.4 Test Support Hardware and Software.

The tollowing items will be required to support DQT3:

- a. GMCC equipment
- b. MPS Remote Maintenance Monitoring System (RMMS) interface to the GMCC for remote communications and control. The IMCS software running on the MPS will be used to monitor the RMS operations and provide remote control of RMS subsystems for maintenance functions. The MMS software running concurrent with IMCS software will be used to perform administrative type functions.
  - c. Printers as required at the GMCC workstation and the MPS.
- d. Appropriate software Microgate 6530 Emulation Software to provide GMCC access to MMS/IMCS, and the following GMCC/OATS software: MS-DOS 3.3, Unix System V OS, StarLAN Software, Calendar/Time Management for use of the GMCC to access MPS representative data.

- e. LM-1 protocol analyzer provides a means to view and record real-time link level data for later analysis. The LM-1 runs on an International Business Machines Corporation (IBM) compatible personal computer (PC).
- f. RMS simulator configured as an Air Traffic Control Beacon Interrogator (ATCBI)-5 RMS.

### 4.3.5 Test Operation Instructions.

The information required to perform DQT3 is contained in this section.

### 4.3.5.1 Test Setup.

The Test Setup for DQT3 assumes that the StarLAN network is fully operational and all required hardware and software is available for network functionality. The Tandem hardware should be directly interfaced with the StarLAN network so that independent MMS/IMCS sessions may be conducted. These sequences will be performed on one of the four active GMCCs to demonstrate that the network is fully functional with the MPS.

### 4.3,5.2 Test Conduct.

The DQT3 consists of 12 test sequences, IT3.1 through IT3.12, which are discussed below and provided in appendix C.

These test sequences will confirm that the GMCC is capable of running in the Full Service System State. The following test sequences are designed to validate these requirements:

- a. DQT3.1 Full Service System State Initialization Test This test sequence will verify that the GMCC equipment is configured and initialized as required to test the GMCC Full Service System State.
- b. DQT3.2 MPS Software Compatibility Test This test will verify that the GMCC is capable of accessing the MPS resident MMS/IMCS software packages by utilizing the Microgate 6530 Terminal Emulation software package.
- c. DQT3.3 Simultaneous Workstation Operation Test This test will verify that all GMCC workstations are operational. The MMS/IMCS operations will be performed on two of more of the workstations simultaneously.
- d. DQT3.4 GMCC Operational Control Test This test will verify that the GMCC has operational control of its jurisdictional facilities by sending commands, acknowledging alarms, and monitoring and unmonitoring of specific sites and/or data points via MMS/IMCS.
- e. DQT3.5 Real-time Monitoring Test This test will verify the capability of the GMCC to perform real-time monitoring of its jurisdictional facilities via MMS/IMCS.
- f. DQT3.6 GMCC Certification Test This test will verify the capability of the GMCC to perform certification of facility performance via MMS/IMCS.

- g. DQT3.7 Status and Alarm Handling Test This test will verify the capability of the GMCC to control status indicators and process alarms via MMS/IMCS.
- h. DQT3.8 Non-Facility Information Monitoring Test This test will verify the capability of the GMCC to monitor non-facility information via MMS/IMCS.
- i. DQT3.9 Full Service System State Response Time Test This test will verify response time requirements by performing response time tests via MMS/IMCS. The response time requirements used for this test are the IMCS response times and do not reflect any specific GMCC response times.
- j. DQT3.10 GMCC Reporting Test This test will verify GMCC reporting functions by utilizing MMS/IMCS functions.
- k. DQT3.11 GMCC Loading Test This test will verify that all GMCC workstations run independent MMS/IMCS sessions simultaneously. All workstations will be running two MMS sessions and a Tandem Advanced Command Language (TACL) session and the effects on the network will be recorded.
- 1. DQT3.12 GMCC Network Reliability Test This test will verify that the GMCC network can reliably process alarms sent continuously from monitored facilities.

### 4,3,5,3 Termination and Restart of Test.

The DQT3 may be terminated and restarted at the last completed test step.

### 4.3.5.4 Safety Considerations.

The DQT3 does not require any special safety considerations.

### 4.3.6 Test Data Reduction and Analysis.

Data analysis for DQT3 will be accomplished by reviewing the GMCC status screens, IMCS database files, and the LM-1 recorded data.

The success of the test will be determined by the system's ability to meet the requirements and give the predicted responses to the step-by-step procedures presented in the Test Conduct Forms for DOT3.

### 4.4 DOT4 - REDUCED SERVICE SYSTEM STATE VERIFICATION.

### 4.4.1 Test Objectives/Expectations.

The objective of DQT4 is to verify Reduced Service System State requirements, via system type tests/demonstrations. Successful completion of DQT4 will be indicated by pass/fail method and through data analysis.

The DQT4 will be verified during subsequent GMCC testing.

### 4,4,2 Test Assumptions and Interdependencies.

For DQT4, it is assumed that the GMCC equipment and accompanying documentation is available at the test site.

### 4.4.3 Manning and Responsibilities.

The DQT4 has the following personnel requirements:

- a. Test Manager Responsible for briefing the test team, defining the necessary test team assignments, coordinating the test resources, assuring proper recording of the test results, red-lining test procedures to reflect as-tested activities, the coordination of Trouble Reports, and debriefing the test team.
- b. Test Engineers Responsible for execution of test activities including operation of the equipment, recording of test data, and analysis of test data to determine results.
- c. GMCC Technician Responsible for maintaining MPS configuration, assisting in MMS/IMCS startup, and assisting in backing up test data. The MPS operator must be on call to maintain MPS operation and support testing if necessary.

### 4.4.4 Test Support Hardware and Software.

The following items will be required to support DQT4:

- a. GMCC equipment
- b. MPS Remote Maintenance Monitoring System (RMMS) interface to the GMCC for remote communications and control. The IMCS software running on the MPS will be used to monitor the RMS operations and provide remote control of RMS subsystems for maintenance functions. The MMS software running concurrent with IMCS software will be used to perform administrative type functions.
  - c. Printers as required at the GMCC workstation and the MPS.
- d. Appropriate software Microgate 6530 Emulation Software to provide GMCC access to MMS/IMCS, and the following GMCC/OATS software: MS-DOS 3.3, Unix System V OS, Microsoft Excel for Windows, Microsoft Word for Windows, StarLAN Software, Superbase 4, PackRat, Back-It, and Status Boards. Service A and B interfaces were not available.
- e. LM-l protocol analyzer provides a means to view and record real-time link level data for later analysis. The LM-l runs on an IBM compatible PC.

### 4.4.5 Test Operation Instructions.

The information required to perform the DQT4 is provided in this section.

### 4.4.5.1 Test Setup.

The DQT4 does not require any special safety considerations.

### 4.4.5.2 Test Conduct.

The DOT4 consists of one test sequence which is provided in appendix C. The requirements for DQT4 have been deferred to subsequent DQT&E testing.

### 4.4.5.3 Termination and Restart of Test.

The DQT4 may be terminated and then restarted at the last completed test step.

### 4.4.5.4 Safety Considerations.

The DQT4 does not require any special safety considerations.

### 4.4.6 Test Data Reduction and Analysis.

Data analysis for DQT4 will be accomplished by comparison of actual and expected test data as defined for the Reduced Service System State requirements. Failure of the GMCC to perform functions in the reduced operations mode will preclude advancing to the next test series.

### 4.5 DOT5 - RECONFIGURED SYSTEM STATE VERIFICATION TEST.

### 4.5.1 Test Objectives/Expectations.

The objective of DQT5 is to verify Reconfigured System State requirements via system type tests/demonstrations. Successful completion of DQT5 will be indicated by pass/fail method and through data analysis.

The DQT5 will be verified during subsequent GMCC testing.

### 4.5.2 Test Assumptions and Interdependencies.

For DQT5, it is assumed that the GMCC equipment and accompanying documentation is available at the test site.

### 4.5.3 Manning and Responsibilities.

The DQT5 has the following personnel requirements:

- a. Test Manager Responsible for briefing the test team, defining the necessary test team assignments, coordinating the test resources, assuring proper recording of the test results, red-lining test procedures to reflect as-tested activities, the coordination of Trouble Reports, and debriefing the test team.
- b. Test Engineers Responsible for execution of test activities including operation of the equipment, recording of test data, and analysis of test data to determine results.
- c. GMCC Technician Responsible for maintaining MPS configuration, assisting in MMS/IMCS startup, and assisting in backing up test data. The MPS operator must be on call to maintain MPS operation and support testing if necessary.

### 4.5.4 Test Support Hardware and Software.

The following items will be required to support DQT5:

- a. GMCC equipment
- b. MPS RMMS interface to the GMCC for remote communications and control. The IMCS software running on the MPS will be used to monitor the RMS operations and provide remote control of RMS subsystems for maintenance functions. The MMS software running concurrent with IMCS software to perform administrative type functions.
  - c. Printers as required at the GMCC workstation and the MPS.
- d. Appropriate software Microgate 6530 Emulation Software to provide GMCC access to MMS/IMCS, and the following GMCC/OATS software: MS-DOS 3.3, Unix System V OS, Microsoft Excel for Windows, Microsoft Word for Windows, StarLAN Software, Superbase 4, PackRat, Back-It and Status Boards. Service A and B interfaces were not available.
- e. LM-1 protocol analyzer provides a means to view and record real-time link level data for later analysis. The LM-1 runs on an IBM compatible PC.

### 4.5.5 Test Operation Instructions.

The information required to perform the DQT5 is provided in this section. The requirements for DQT5 have been deferred to subsequent DQT&E testing.

### 4.5.5.1 Test Setup.

TBD

### 4.5.5.2 Test Conduct.

The DQT5 consists of two test sequences, DQT5.1 and DQT5.2, which are discussed below and provided in appendix C. These test sequences will confirm that the GMCC is capable of running in the Reconfigured System State. The DQT5.1 test will verify that the GMCC is able to perform all of the functions specified for the Full Service System State except that the GMCC shall not allow the operators to alter the status of any facility in its jurisdiction. Any time that a GMCC transfers all of its operational responsibilities to an Area Control Facility MCC (AMCC) or another GMCC serviced by the same MPS, it is considered to be in the Reduced Operations Mode. Therefore, verification of reduced operations mode will be conducted by performing a subset of DQT3 tests and demonstrations.

The DQT5.2 test will verify that the GMCC will accept the operational responsibility for another GMCC serviced by the same MPS.

### 4.5.5.3 Termination and Restart of Test.

The DQT5 may be terminated and then restarted at the last completed test step.

### 4.5.5.4 Safety Considerations.

The DQT5 does not require any special safety considerations.

### 4.5.6 Test Data Reduction and Analysis.

Data analysis for DQT5 will be accomplished by comparison of actual and expected test data as defined for Reconfigured System State requirements. Failure of the GMCC to perform functions in the reconfigured operations mode will preclude advancing to the next test series.

APPENDIX A - TEST VERIFICATION REQUIREMENTS TRACEABILITY MATRIX (TVRTM) The TVRTM identifies the DQT&E requirements and relates them to the individual tests in the Test Procedures that verify them. Requirements which have been deferred or not implemented in this phase of testing are so noted in the TVRTM.

## APPENDIX B

NAS SPECIFICATION TEST VERIFICATION REQUIREMENTS TRACEABILITY MATRIX (TVRTM)

This TVRTM identifies specific NAS requirements from NAS-SS-1000 Volume I, NAS SS-1000 Volume V, and NAS-MD-794, and relates them to the individual tests in the Test Procedures that verify them.

APPENDIX B: NAS-SS-1000 VOLUME I TEST VERIFICATION REQUIREMENTS TRACEABILITY MATRIX (TVRTM)

	Notes				
Cross Reference GMCC DQT&E Test Procedures	Test Name	ALL	Status/Alarm Handling	Simultaneous WS Operation	ALL
Cross R DQT&E I	Test ID	юдтз	DQT3.7	ротз.3	ротз
Verifi-	Method	a	۵	A	Q
Requirement Description		Continually monitor subsystem performance to obtain the data needed by specialists for maintenance and operations support.	Provide the status of subsystem to specialists and generate an alarm upon the deviation of designated parameters from prescribed limits.	Provide for the organization and processing of the information necessary for the management of maintenance resources and the preparation of NAS status reports.	Provide the specialist access to the monitoring, control, and data management capabilities.
